

# NuShellX Tutorial

Presented by:

Adam B Jones

**MICHIGAN STATE**  
**UNIVERSITY**

U.S. DEPARTMENT OF  
**ENERGY**

Office of Science

# Outline

- How to obtain NuShellX.
- Starting NushellX
- Calculating Spectra
- Calculating transitions.

# How to Obtain NuShellX

- From B. A. Brown's website

- NuShellX@MSU for Windows PC can be obtained by sending an email to:
  - » [brown@nscl.msu.edu](mailto:brown@nscl.msu.edu)
- This version runs directly on any Windows PC without the need for any other software.
- NuShellX@MSU is an adaption of W.D.M.Rae's code NuShellX with input and output files similar to the older Oxbash code.
- W.D.M Rae's original version of the code can be obtained at his website.
  - » <http://www.garsington.eclipse.co.uk/>

- There are versions of NuShellX that are made to run on different platforms.

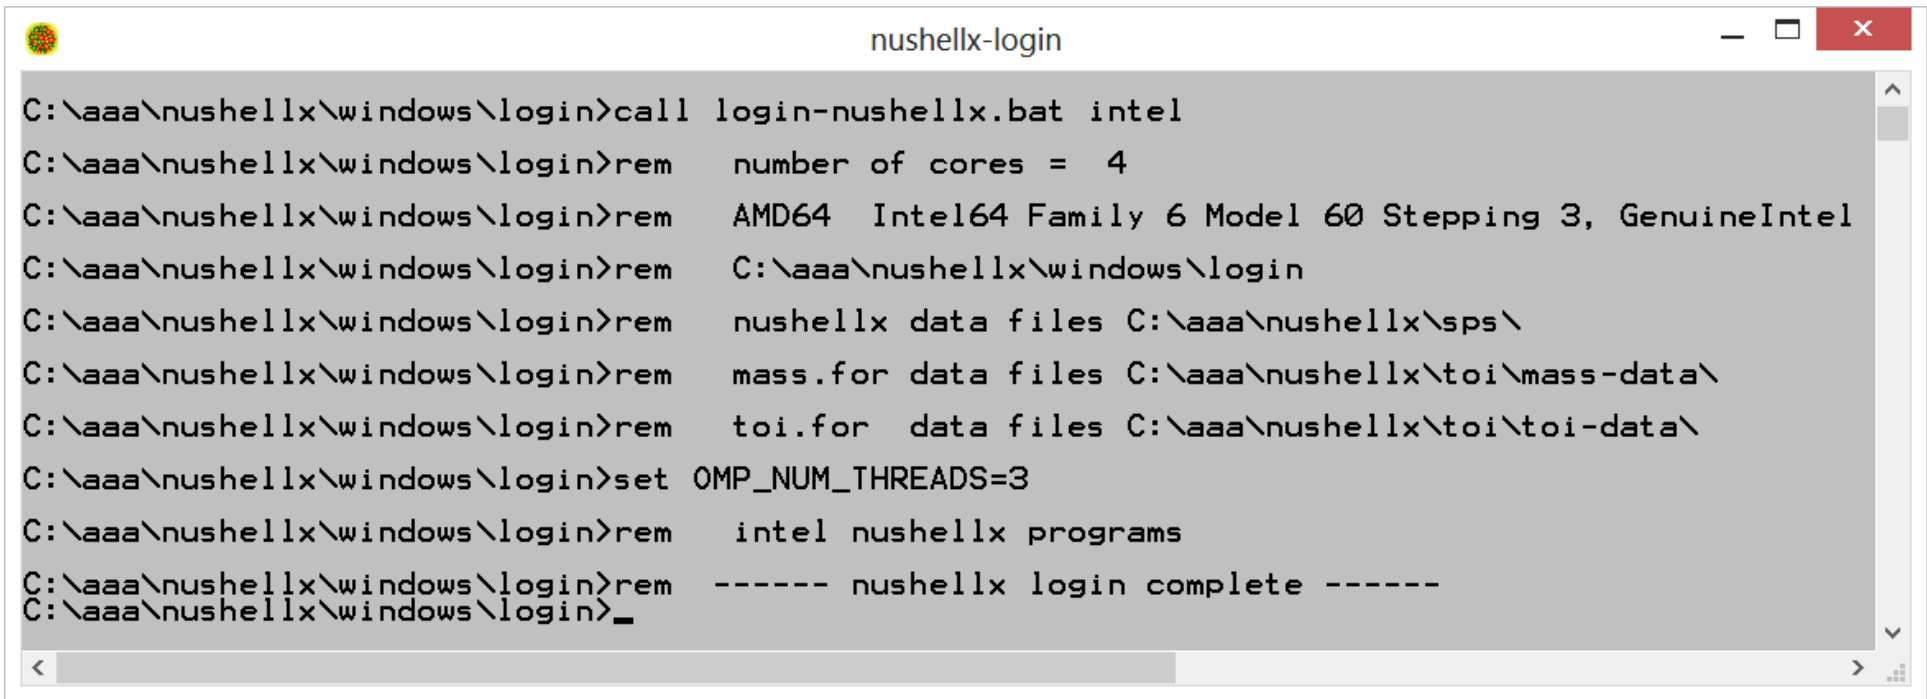

- As far as I know only the windows version is kept up to date so be aware that the versions for different platforms may be inconsistent.

# Starting NuShellX -login

- NuShellX is designed to be used with a special terminal window.
  - The window has commands aliased in a way that is supposed to be independent of the platform used.
  - This is important because NuShellX is designed to set up and run the shell model interactions using scripts to run different programs and manage their inputs and outputs.
- To start this terminal window find the shortcut in the login directory:
  - The windows example is:
    - » C:\aaa\nushellx\windows\login
    - » “nushellx-login” is the name of the shortcut
    - » You can relocate this shortcut wherever is convenient for you.
- The “nushellx-login” shortcut runs the “login-nushellx.bat” script this script sets up the terminal used for nushellx calculations.
  - You may need to modify this file to suit your purposes.
  - It is recommended that you change the “OMP\_NUM\_THREADS” variable to 1 less than the number of cores on your machine so that you reduce contention with your operating system.

# Example NuShellX -login

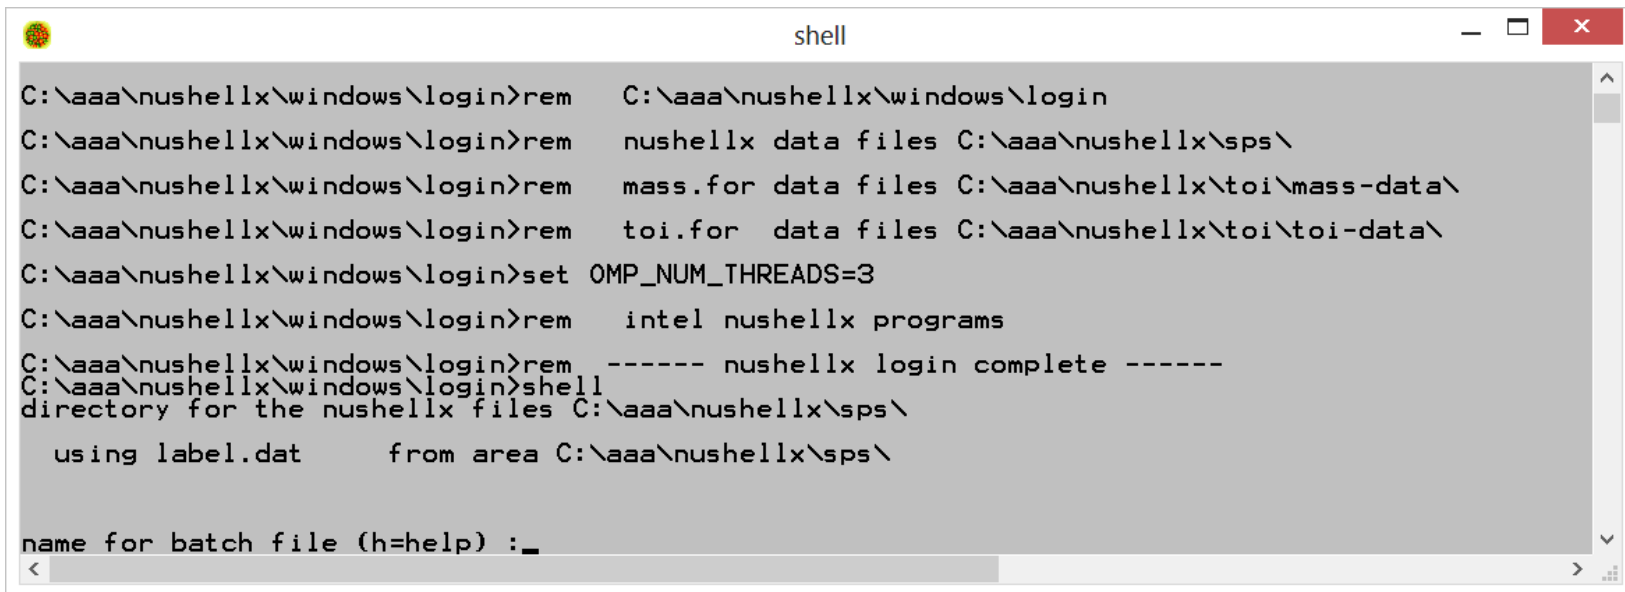

- Below is an example of the nushellx terminal window.
  - The login script is set up to print information about the system on startup.
- Take a moment and start your own terminal window.
  - Verify the OMP\_NUM\_THREADS is a reasonable value for your system.

```
C:\aaa\nushellx\windows\login>call login-nushellx.bat intel
C:\aaa\nushellx\windows\login>rem    number of cores = 4
C:\aaa\nushellx\windows\login>rem    AMD64  Intel64 Family 6 Model 60 Stepping 3, GenuineIntel
C:\aaa\nushellx\windows\login>rem    C:\aaa\nushellx\windows\login
C:\aaa\nushellx\windows\login>rem    nushellx data files C:\aaa\nushellx\sps\

C:\aaa\nushellx\windows\login>rem    toi.for  data files C:\aaa\nushellx\toi\toi-data\
C:\aaa\nushellx\windows\login>set  OMP_NUM_THREADS=3
C:\aaa\nushellx\windows\login>rem    intel nushellx programs
C:\aaa\nushellx\windows\login>rem    ----- nushellx login complete -----
C:\aaa\nushellx\windows\login>_
```

# Calculation of $^{20}\text{Ne}$ Spectrum

- The simplest operation in NuShellX is to calculate the spectrum of a single nucleus.
- The first step is to specify the parameters of the calculation and generate the script that will run the calculation.
  - This is done by running the program “shell” in the terminal window.
  - Be sure to navigate to an empty directory because many files will be created.
  - Simply type shell and press enter.

```
shell
C:\aaa\nushellx\windows\login>rem C:\aaa\nushellx\windows\login
C:\aaa\nushellx\windows\login>rem nushellx data files C:\aaa\nushellx\sps\
C:\aaa\nushellx\windows\login>rem mass.for data files C:\aaa\nushellx\toi\mass-data\
C:\aaa\nushellx\windows\login>rem toi.for data files C:\aaa\nushellx\toi\toi-data\
C:\aaa\nushellx\windows\login>set OMP_NUM_THREADS=3
C:\aaa\nushellx\windows\login>rem intel nushellx programs
C:\aaa\nushellx\windows\login>rem ----- nushellx login complete -----
C:\aaa\nushellx\windows\login>shell
directory for the nushellx files C:\aaa\nushellx\sps\
    using label.dat      from area C:\aaa\nushellx\sps\

name for batch file (h=help) :_
```

# Calculation of $^{20}\text{Ne}$ Spectrum

- Enter a name for the batch file.
  - It is useful to have a naming convention that distinguishes what type of calculation is done.
    - » Here we will name it after the nucleus we intend to calculate: “ne20”.
- We want option “lpe”
  - “lpe” is the option to calculate wave functions and spectra.
    - » The “lpe” option will be used before any other calculation.
  - The “den” option is for calculating wave function overlaps.
    - » We will discuss this in later slides
  - “help” will provide more information.
  - “st” ends the generation of the batch file.
    - » You can put as many calculations in the batch file as you wish.

# Calculation of $^{20}\text{Ne}$ Spectrum

- Next you will be prompted for the model space name: input “sd”.
  - The model space names can be found in the first column of the file “label.dat” in the directory following directory
    - » C:\aaa\nushellx\sps
    - » This file is an input to NuShellX and the file path is always printed when shell is run.
  - The model space refers to the single particle orbitals that the valence particles can occupy.
    - » “sd” refers to the 1s0d shell of the harmonic oscillator.
    - » It is critical to choose the appropriate model space for your problem.
- You will be asked if you wish to restrict the model space. Press enter.
  - A blank answer is the same as “n” for no.
  - You may wish to do this if you are calculating in a large space.
  - It is not recommended to limit your model space unless absolutely necessary.

# “label.dat”

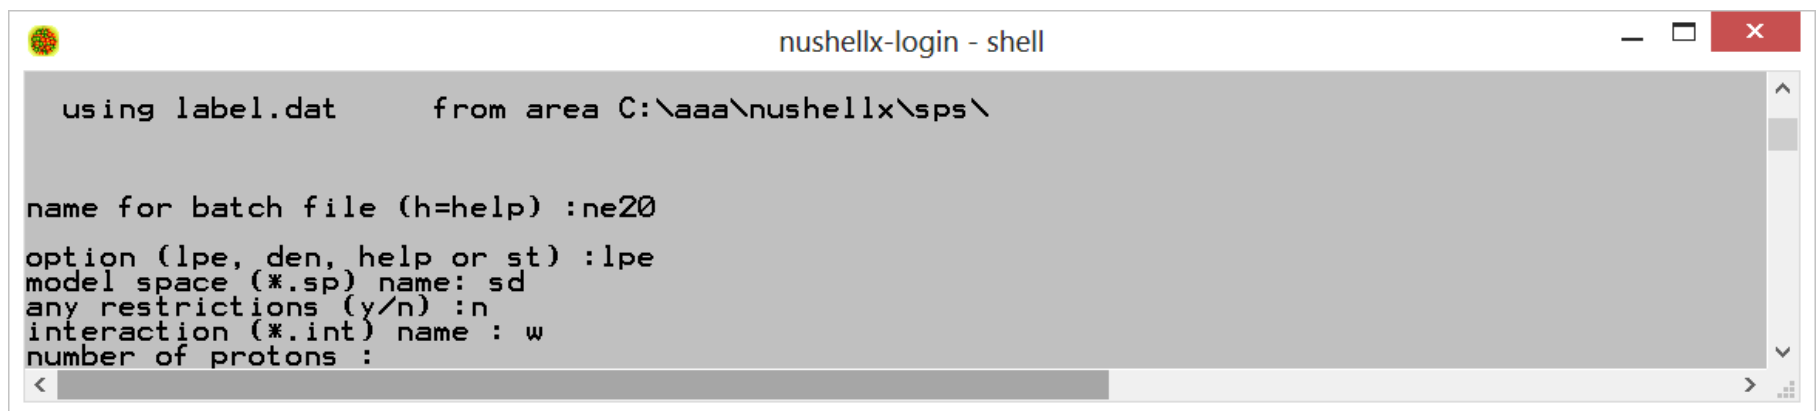

- Model space (\*.sp file) name  
(single-particle state file name)
- Interaction (\*.int file) name
  - In some cases the interaction may consist of several pieces which are read into MATRIX separately. In this case this interaction name is the code word which tells SHELL which \*.INT files to include.)
- Model space code used for the output files
  - (The labels "p" and "n" should be reserved for charge-dependent interaction names)
- Interaction code used for the output files
- References and information

```

# Calculation of $^{20}\text{Ne}$ Spectrum

- The interaction we will use is “w”:
  - The interaction name can be found in the second column “label.dat” file.
  - The selection of the appropriate interaction is critical to the validity of a calculation.
    - » Warning! Not all interactions in the sps directory are intended for the end user.
  - The “label.dat” has literature references for some interactions listed in the rightmost column.
    - » An example row of “label.dat”
      - sd w b w ! (W) WILDENTHAL'S A=17-39 "USD" INT (JULY 1982)
    - » It is recommended that you check the literature for the interaction you use before drawing any conclusions from the results of your calculation.

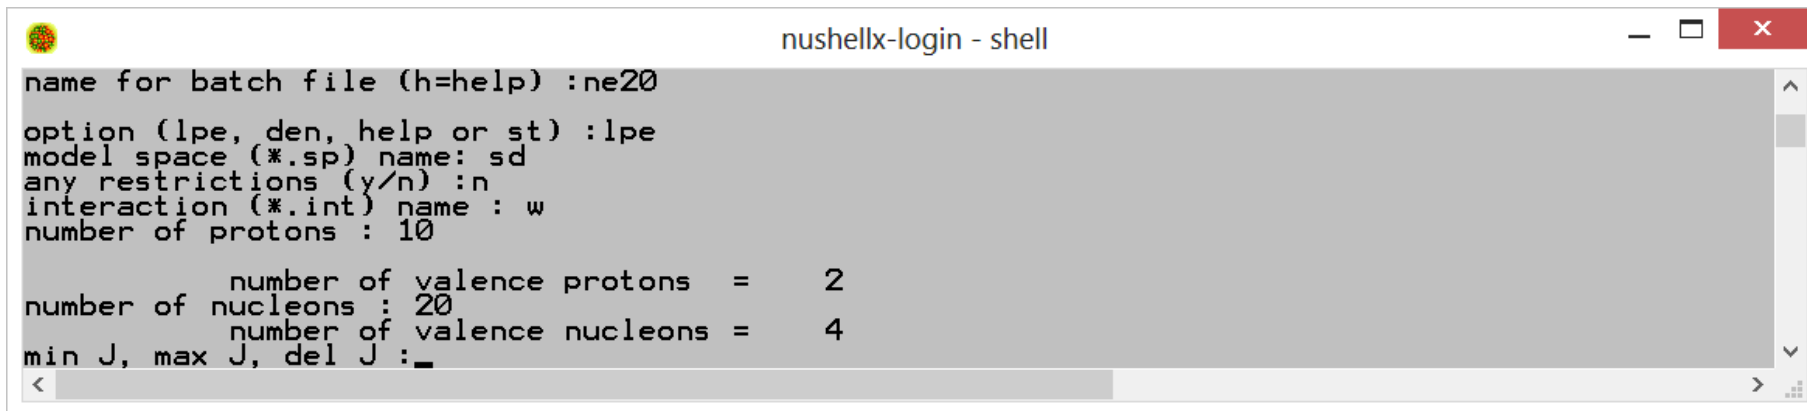

```
nushellx-login - shell

using label.dat      from area C:\aaa\nushellx\sps\

name for batch file (h=help) :ne20
option (lpe, den, help or st) :lpe
model space (*.sp) name: sd
any restrictions (y/n) :n
interaction (*.int) name : w
number of protons :
```

# Calculation of $^{20}\text{Ne}$ Spectrum

- You will be prompted to enter the number of protons: “10”
- Number of nucleons is “20”
  - The terminal will display the number valence protons and the number of valence nucleons.
    - » It is a good idea that you check to see if your idea of the many body problem matches up with the output.
    - » If this doesn't seem right make sure your model space, proton, and nucleon numbers are correct.
    - » Hint: negative numbers are bad.

```
name for batch file (h=help) :ne20
option (lpe, den, help or st) :lpe
model space (*.sp) name: sd
any restrictions (y/n) :n
interaction (*.int) name : w
number of protons : 10

number of valence protons = 2
number of nucleons : 20
number of valence nucleons = 4
min J, max J, del J :_
```

# Calculation of $^{20}\text{Ne}$ Spectrum

- Min J, max J, del J: “0.0, 8.”
  - Omitting the “del J” argument is equivalent to using “1.0”
  - It is recommended that you calculate all values of angular momenta that you desire at the same time to take advantage of your processor’s parallelism.
    - » Don’t make different batch files for individual angular momentum values.
  - Restricting the momentum is one way to reduce the runtime of the calculation.
- Parity “0”
  - Restricting parity is another way to reduce the runtime of calculations.
- Shell will output an estimate of the runtime for the different angular momentum partitions.
  - Check this before you run a calculation for the first time so you know what to expect.
  - If any runtime is very large think about what types of restrictions you can make to the angular momentum and parity.
    - » It is also possible to restrict the number of eigenvalues calculated for each partition
    - » Only as a last resort should you restrict your model space.

# Calculation of $^{20}\text{Ne}$ Spectrum

- After the runtime estimates for the different partitions shell will output the wavefunction output names.
  - These will be important for calculating transitions which we will discuss later.
- You will be prompted to enter another option: “st”
  - This tells shell you are done specifying a calculation and it should write the batch file.
  - If you enter lpe or den you can specify more calculations to be added to the batch file.

```
nushellx-login - shell
parity (0 for +) (1 for -) (2 for both) :0
number of proton partitions = 6
number of neutron partitions = 6

option (lpe, den, help or st) :_
```

# The “.ans” file

- This file stores the answers to shell so the batch file can be produced on demand.
- This is useful for producing large numbers of batch files using your own code or reproducing a calculation from someone else.
- It is also useful if you are prone to typos.
- To use the “.ans” file generated in our example type the command:
  - “shell ne20.ans”
  - The contents of this file are shown below.

```
-----  
lpe,   0           ! option (lpe or lan), neig (zero=10)

# Calculation of $^{20}\text{Ne}$ Spectrum

- You have exited shell and now will be prompted to run the batch file.
  - This will execute a series of programs to generate the outputs that we specified.
- Simply type the name you entered at the first prompt: "ne20"
  - It should take less than a minute.
  - Many hundreds of output files will be generated.
    - I have no idea what the function is of most of these files.
- NuShellX always generates some human readable output summaries that contain useful information.
  - For the spectrum of the nucleus look for an ".lpt" file that starts with the batch file name.
    - In our example it is: "ne20w.lpt"

# Calculation of $^{20}\text{Ne}$ Spectrum

- The states are indexed in the first column in order of energy.
- The  $J_\pi$  partition is indexed in the second column.
  - The first three states are the first state of their partition.
  - The 4th state is the second  $0_+$ .
- The third column is the absolute energy of the eigenstate.
- The fourth column is the energy relative to the lowest energy state calculated.
  - This is not necessarily the ground state.

# Calculation of $^{20}\text{Ne}$ Spectrum

- The fifth column is the angular momentum.
- The sixth column is the isospin projection.
- The seventh column is the parity.
  - In our example the parity is always 1 (for plus) because we restricted the parity we calculated.
- The eighth column has the energy relative to the least energy state only if it is the first state of a given  $J_\pi$ .
- The ninth column names the output file of the wave functions.
  - These are useful for calculations of wave function overlap.

```

# Wave function file names

- The name of the wave function files contains information about the states they describe.
- Example: bw240c.lpe
  - “b” is the symbol for the model space found in label.dat
    - Here b stands for the “sd”
  - “w” is the symbol for the interaction found in label.dat
    - “w” happens to be the name of the potential as well but this is not always the case.
  - “2” symbol for the number of valence protons
    - Happens to be the number of valence protons but this is true only of single digit numbers.
    - See the table to the right
  - “4” is the symbol for the number of valence nucleons.
  - “0” is the symbol for the parity
    - 0 for + and 1 for -
  - “c” is the symbol for two times the spin.
    - 12 in this case
    - This means the spin is 6.
- The table to the right comes from the help file
  - C:\aaa\nushellx\help

The symbols for J, T and N correspond to the following numbers

|        |        |        |        |        |         |         |
|--------|--------|--------|--------|--------|---------|---------|
| 0 - 0  | k - 20 | f - 40 | 0 - 60 | h - 80 | f - 100 | 0 - 120 |
| 1 - 1  | l - 21 | g - 41 | 1 - 61 | l - 81 | g - 101 | 1 - 121 |
| 2 - 2  | m - 22 | h - 42 | 2 - 62 | m - 82 | h - 102 | 2 - 122 |
| 3 - 3  | n - 23 | i - 43 | 3 - 63 | n - 83 | i - 103 | 3 - 123 |
| 4 - 4  | o - 24 | j - 44 | 4 - 64 | o - 84 | j - 104 | 4 - 124 |
| 5 - 5  | p - 25 | k - 45 | 5 - 65 | p - 85 | k - 105 | 5 - 125 |
| 6 - 6  | q - 26 | l - 46 | 6 - 66 | q - 86 | l - 106 | 6 - 126 |
| 7 - 7  | r - 27 | m - 47 | 7 - 67 | r - 87 | m - 107 | 7 - 127 |
| 8 - 8  | s - 28 | n - 48 | 8 - 68 | s - 88 | n - 108 | 8 - 128 |
| 9 - 9  | t - 29 | o - 49 | 9 - 69 | t - 89 | o - 109 | 9 - 129 |
| a - 10 | u - 30 | p - 50 | a - 70 | u - 90 | p - 110 | a - 130 |
| b - 11 | v - 31 | q - 51 | b - 71 | v - 91 | q - 111 |         |
| c - 12 | w - 32 | r - 52 | c - 72 | w - 92 | r - 112 |         |
| d - 13 | x - 33 | s - 53 | d - 73 | x - 93 | s - 113 |         |
| e - 14 | y - 34 | t - 54 | e - 74 | y - 94 | t - 114 |         |
| f - 15 | a - 35 | u - 55 | f - 75 | a - 95 | u - 115 |         |
| g - 16 | b - 36 | v - 56 | g - 76 | b - 96 | v - 116 |         |
| h - 17 | c - 37 | w - 57 | h - 77 | c - 97 | w - 117 |         |
| i - 18 | d - 38 | x - 58 | i - 78 | d - 98 | x - 118 |         |
| j - 19 | e - 39 | y - 59 | j - 79 | e - 99 | y - 119 |         |

# The “.eps” file

- NuShellX Will automatically generate simple level scheme diagrams in the encapsulated post script format.
- You need an eps viewing program to display these diagrams.
  - There is a freeware viewer called “gsview” you can download.
- On the right the diagram in the file “ne20w.eps” is shown.
- The length of the line is proportional to the angular momentum of the state.
  - The angular momentum and parity is labeled only for the lowest level of that angular momentum.
  - The color of the line indicates parity.
- The experimental values come from a database included with NuShellX.
  - I do not know what data is in this database or when it was last updated.
  - It is recommended that this data be used only as a qualitative guide.
  - Numerical values can be found in the file: “ne20exp.lpt”

# M1 and E2 transition in $^{20}\text{Ne}$

- We have already calculated the wave functions and energies we need for this example.
- The following inputs could have been appended to our previous inputs in shell.
- To begin type: “shell”
  - Make sure you are still in the directory with the previous output.
- We will make a batch script with a different name: “ne20t”
  - We could overwrite our previous script but we will keep it for completeness.
- We are interested in one body transition densities: “t”
  - Note we can also calculate 2 body transition densities and spectroscopic factors.
- We need to specify the file name that contains the initial state: “bw2400”
  - Note: the final 2 characters are modified by shell when we specify later arguments.
  - It should always be safe to end the file name with “00”.

# M1 and E2 transition in $^{20}\text{Ne}$

- We are interested in only one initial state. “1”
  - This is one state for a given angular momentum value.
- We need to specify the file for the final state. “bw2400”
  - Once again the final two characters will be modified by later input.
- We will calculate 5 final states per angular momentum value: “5”
- We are interested in only states with  $J=0$  and  $J=2$ : 0,2,2
- Again: 0,2,2.
  - At this point shell has enough information to find the desired wave function overlap files.
- We wish to restrict the tensor ranks because we are interested only in E1 and M2 transitions: “y”
- For the M1 and E2 transitions: “1,2”
- We have everything we need: “st”
- Run the batch file by entering: “ne20t”

# The “.deo” file

- After the calculation has run the human readable summary file is output to the current directory:
  - In our test case it is: ne200w.deo.
  - This file has all the details relevant to gamma decay.
  - There is another file that has simpler formatting and some different information with the extension “.dei”. We will not discuss this in detail.
- The output is arranged by blocks of initial states.
  - Initial state information is in a single row at the start of a block.

```
gamma decay for ne200w.deo      BR greater than  0.000

! model space = sd
! interaction = w
! e_p =  1.360    e_n =  0.450    E2
! g_sp =  4.940    g_sn = -3.380    M1 spin
! g_lp =  1.137    g_ln = -0.079    M1 orbital
! g_pp =  0.340    g_pn = -0.220    M1 tensor
```
